- Saves your Internet bandwidth for work and not spam
- Improved resilience & disaster recovery
- No capital expenditure required
- Technical support, upgrades & capacity management included

## KCS Email Filtering Service

Email is now a key communication tool. Email spam is a serious hindrance to the effective use of email. Thus the KCS Email Filtering Service deals with the spam problem and its attendant viruses and restores the efficacy of email as a key communication tool.

Over half of all email is spam. Whilst the good news is that the percentage of email that is spam is falling the bad news is that the malware and phishing content that it carries is rising. The main goal of most malicious email, either malware or phishing, is to steal confidential data. However using the victim's email system and contact lists to further spread spam and malware is a common ploy. The most popular types of malware are now multifunctional: they can steal data from the victim's computer, make the computer part of a botnet or download and install other malicious programs without the user's knowledge. Spam email malicious or otherwise waste's staff time, Internet bandwidth and IT resources.

Organization's wish to make best use of staff time, respond rapidly to important communiques and deal with all work emails appropriately. Whilst this is best served by the removal of all spam and its attendant security risks this is not possible. What is junk email to one maybe useful information to another. Therefore the best approach is use an intelligent system such as KCS Email Filtering Service with its multi-layered ant-spam analysis, dual anti-virus engine and user authentication to remove the vast majority of spam and attendant malware and leave vigilant staff to decide on the balance of the email based on its content. Then when the staff respond or send out new emails this too is checked for malware to protect your organization from unwittingly spreading malware to your email recipients.

With inbound email cleaned by the KCS Email Filtering Service staff can readily identify work emails and respond accordingly. With outbound email also cleaned by the same service your organization plays its part in protecting the recipients of your email. With the KCS Email Service provided in the Cloud complete with full migration and technical support there is no requirement for onsite equipment, capital expenditure nor additional technical support. The KCS Email Filtering Service also provides your organization with an additional layer of security and email service resilience.

## Security, Resilience & Disaster Recovery

KCS Email Filtering Service is a cloud solution and benefits from:

- Multiple virtual machine email towers for resilience, load sharing auto failover
- Email buffered on high availability storage in the event that your email server is off line
- Auto updated multilayer anti-spam and dual anti-virus engines
- 99.9% uptime
- N+1 standard generator, UPS and air conditioned data centre

The KCS Email Filtering Service also has the option of hosting your email server(s) in the Cloud if so required.
