

RANSOMWARE

What is meant by off-site back-up?

Offsite back-up is the process of copying the important files and data from your office and saving them somewhere else for safekeeping.

In doing this, it safeguards the data in case of any unfortunate event.

All data will be backed-up automatically.

Without off-site back-up, data recovery can cost thousands.

Why is it important for your business?

As sadly indicated by the attach on Travelex, ransomware attacks are too common.

It is important for your business to be fully prepared for any events.

A ransomware attack can occur simply by a member of staff clicking on a link that is a hidden virus.

One click can cost your business both time, money and serious damage.

Therefore, arranging an off-site back-up of your business' sensitive data will mean that your data can be quickly restored should need arise.

What can Keyfort do for you?

We are able to do an automatic back-up for private, educational and not-for-profit organisations and deal with cyber security issues as a standard part of day-to day business.
